Hello,

The following submission has been created.

Track Name: Artificial Intelligence and Data Science

Paper ID: 1653

Paper Title: From Mindful Living to Algorithmic Dependence: Psychological Consequences of AI-Driven Health and Wellness Applications

Abstract:

It often goes unnoticed when switching from something that helps to something that we need. One of the latest examples of this phenomenon is connected with the influence of artificial intelligence on our daily routine. We are already starting our day with wearing a fitness tracker before our shoes and counting the number of calories eaten thanks to apps that turn food into numeric values. Previously, we would only share our secrets and thoughts with our closest people, but nowadays we can simply use chatbots for such communication. They assist in developing our competencies, including knowing about the hunger or learning to walk along an unfamiliar street and coping with emotions. These minor irritations in our daily schedule give rise to our human skills. There is a lot of evidence for a number of truths that have long been acknowledged by all of us. Among the newest terms coined due to the use of artificial intelligence technology through a sleep tracker is "orthosomnia". Apps that help keep track of calorie intake often come up in the medical history of those who suffer from eating disorders. Recent studies show that the proof of the inability of some people to recognize internal body cues, or "interoceptive awareness", prevents them from recognizing their bodily requirements because they got to know themselves through technological devices. Here are the three questions the present paper tries to answer:
Where does the boundary lie between the stage where tracking yourself becomes counterproductive for you and starts controlling you? What is the impact on learning empathy, non-verbal intelligence, and conflict resolution from artificial intelligence companions instead of humans? What cognitive skills will we sacrifice by that?
